

Google sheets countif date between

Continue

Like Microsoft Excel, Google Sheets includes a simple COUNT function that tells you the number of items in the selected range. But what if you want to know the number of items based on some condition — like only the products in a list that are below a certain price, or only the cities in a specific state? That's when you would use the COUNTIF function. As the name implies, COUNTIF combines the abilities of COUNT and IF — it checks to see if the IF argument is true before returning the COUNT value. Here's what the function looks like: `=COUNTIF(range, criterion)`Range: This is the range of cells you want to test against some sort of criterion and then sum.Criterion: This is what you want to use to test against the range. You can use a number, text, or even a date as your criterion. Important: Note that COUNT just tells you how many numbers there are in a range. If what you really want to know is how much those numbers add up to, you'll want to use the SUM function instead. How to use COUNTIF in Google Sheets with a number conditionUsing COUNTIF in your own Google Sheets is pretty straightforward, since you only need to specify two arguments. Suppose you had a spreadsheet like this in which you wanted to know how many items cost less than \$500. You can use the COUNTIF function to find the number of items in this list that cost less than \$500. Dave Johnson/Insider 1. Type "COUNTIF" and press the Tab key. Google Sheets automatically adds the open parenthesis. 2. Click and drag the mouse to select the column that has the pricing information. 3. Type a comma and then enter the criteria — in this case "`<500`". How to use COUNTIF with a text conditionThe COUNTIF function can also sum items based on text criteria. If you needed to find out how many items in a list have a particular color, you would do this:1. Type "COUNTIF" and press the Tab key. Google Sheets automatically adds the open parenthesis. 2. Click and drag the mouse to select the column that has the color information. 3. Type a comma and then enter the criteria, such as "blue" (include the quotes).4. Press the Tab key. You should see the result. You can use a text criterion to find how many items have that matching text. Dave Johnson/Insider If you're looking for the sum of all the cells that don't have this value, that's easy to do as well — just use the NOT operator, like this: `=COUNTIF(A1:A12,"blue")`Likewise, the COUNTIF function is often used to find the number of entries that are blank, or the number that are not blank. This can be handy for cleaning up a messy spreadsheet. Find the blanks with a pair of quotes with nothing between: `=COUNTIF(A1:A12,"")`And the non-blank entries can be found with a NOT operator: `=COUNTIF(A1:A12,"")` How to use COUNTIF with a wildcardWildcards can come in handy because they help you find partial matches, such as all the descriptions that mention the color red. 1. Type "`=COUNTIF`" and press the Tab key.2. Click and drag the mouse to select the column with the product descriptions. 3. Type a comma and then enter "`*red*`" (include the quotation marks).4. Press the Tab key. Google Sheets will add the closing parenthesis and you should see the result in the cell. In this example, we're looking for cells that contain the word red anywhere. But you could use "`*red*`" to find cells that end with the word red or "`red*`" for cells that begin with red. How to use COUNTIF with a date conditionThe COUNTIF function can return the number of items that correspond to a particular date. Suppose we want to total all the sales that happened on January 15. 1. Type "`=COUNTIF`" and press the Tab key.2. Click and drag the mouse to select the column with the range of dates. 3. Type a comma and then enter "`DATE(2021, 1,15)`" (do not include the quotation marks).4. Press the Tab key. Google Sheets will add the closing parenthesis and you should see the result in the cell. As you can probably guess, you can use variations of this argument with logical operators: `=COUNTIF(D1:D8,">=DATE(2021,1,7))`. This returns the number of items dated on or after January 7. `=COUNTIF(D1:D8,"<&DATE(2021,1,7))`. This returns the number of items with any date other than January 7. By combining logical operators with the date, you can find the number of items that are associated with a specific date range. Dave Johnson/Insider COUNTIF is a pretty simple function to get the hang of, but here are a few tips to keep in mind: If you want to count the number of days between two dates, you can use the DAYS, DATEDIF, and NETWORKDAYS functions in Google Sheets to do so. DAYS and DATEDIF count all days, while NETWORKDAYS excludes Saturday and Sunday. Counting All Days Between Two Dates To count the days between two dates, regardless of whether the day is a weekday or a holiday, you can use the DAYS or DATEDIF functions. Using the DAYS Function The DAYS function is the easiest to use, so long as you're not fussed about excluding holidays or weekend days. DAYS will take note of additional days held in a leap year, however. To use DAYS to count between two days, open your Google Sheets spreadsheet and click on an empty cell. Type `=DAYS("01/01/2019","01/01/2018")`, replacing the dates shown with your own. Use your dates in reverse order, so put the end date first, and the start date second. Using the start date first will result in DAYS returning a negative value. As the example above shows, the DAYS function counts the total number of days between two specific dates. The date format used in the example above is the U.K. format, DD/MM/YYYY. If you're in the U.S., make sure you use MM/DD/YYYY. You'll need to use the default date format for your locale. If you want to use a different format, click File > Spreadsheet Settings and change the "Locale" value to another location. You can also use the DAYS function with cell references. If you've specified two dates in separate cells, you can type `=DAYS(A1, A11)`, replacing the A1 and A11 cell references with your own. In the example above, a difference of 29 days is recorded from dates held in cells E6 and F10. Using the DATEDIF Function An alternative to DAYS is the DATEDIF function, which allows you to calculate the number of days, months, or years between two set dates. Like DAYS, DATEDIF takes leap days into account and will calculate all days, rather than limit you to business days. Unlike DAYS, DATEDIF doesn't work in reverse order, so use the start date first and the end date second. If you want to specify the dates in your DATEDIF formula, click on an empty cell and type `=DATEDIF("01/01/2018","01/01/2019","D")`, replacing the dates with your own. If you want to use dates from cell references in your DATEDIF formula, type `=DATEDIF(A7,G7,"D")`, replacing the A7 and G7 cell references with your own. Counting Business Days Between Two Dates The DAYS and DATEDIF functions allow you to find the days between two dates, but they count all days. If you want to count business days only, and you want to discount additional holiday days, you can use the NETWORKDAYS function. NETWORKDAYS treats Saturday and Sunday as weekend days, discounting these during its calculation. Like DATEDIF, NETWORKDAYS uses the start date first, followed by the end date. To use NETWORKDAYS, click on an empty cell and type `=NETWORKDAYS(DATE(2018,01,01),DATE(2019,01,01))`. Using a nested DATE function allows you to convert years, months, and dates figures into a serial date number, in that order. Replace the figures shown with your own year, month, and date figures. You can also use cell references within your NETWORKDAYS formula, instead of a nested DATE function. Type `=NETWORKDAYS(A6,B6)` in an empty cell, replacing the A6 and B6 cell references with your own. In the above example, the NETWORKDAYS function is used to calculate the working business days between various dates. If you want to exclude certain days from your calculations, like days of certain holidays, you can add these at the end of your NETWORKDAYS formula. To do that, click on an empty cell and type `=NETWORKDAYS(A6,B6,{B6:D6})`. In this example, A6 is the start date, B6 is the end date, and the B6:D6 range is a range of cells containing days of holidays to be excluded. You can replace the cell references with your own dates, using a nested DATE function, if you'd prefer. To do this, type `=NETWORKDAYS(E11,F13,{DATE(2019,11,18),DATE(2019,11,19)})`, replacing the cell references and DATE criteria with your own figures. In the above example, the same range of dates is used for three NETWORKDAYS formulae. With 11 standard business days reported in cell B2, between two and three additional holiday days are removed in cells B3 and B4. Read time: 25 minutes Using the COUNTIFS function you can achieve the result of counting numbers of cells which contain values between two numbers in a range. Using the COUNTIFS Function Between Two Values The COUNTIFS function can show the count of cells that meet your criteria. You can use COUNTIF with criteria using dates, numbers, text and other conditions. Using COUNTIFS you also need to use logical operators (>,<= for greater than or equal to Use
